#### Abstract

The homogeneous cubic equation with four unknowns represented by the Diophantine equation $\mathrm{x}^{3}+\mathrm{y}^{3}=21 \mathrm{zw}^{2}$ is analyzed for its patterns of non - zero distinct integer solutions. A few interesting properties between the solutions and special numbers, namely, Polygonal number, Pyramidal number, Centered polygonal number, Stella octangular number and Octahedral number are presented.

Keywords: Homogeneous cubic, Cubic equation with four unknowns, Integral solutions, Cubic Diophantine equation, Third degree equation, Special numbers.

## Notations Used

- Polygonal number of rank n with size m

$$
\mathrm{t}_{\mathrm{m}, \mathrm{n}}=\mathrm{n}\left[1+\frac{(\mathrm{n}-1)(\mathrm{m}-2)}{2}\right]
$$

- Pyramidal number of rank $\mathbf{n}$ with size $\mathbf{m}$.

$$
\mathrm{p}_{\mathrm{n}}^{\mathrm{m}}=\frac{1}{6}[\mathrm{n}(\mathrm{n}+1)][(\mathrm{m}-2) \mathrm{n}+(5-\mathrm{m})]
$$

- Centered polygonal number of rank n with size m .

$$
\mathrm{ct}_{\mathrm{m}, \mathrm{n}}=\frac{\mathrm{mn}(\mathrm{n}+1)+2}{2}
$$

- Stella octangular number of rank n

$$
\mathrm{SO}_{\mathrm{n}}=\mathrm{n}\left(2 \mathrm{n}^{2}-1\right)
$$

- Octahedral number of rank $n$

$$
\mathrm{OH}_{\mathrm{n}}=\frac{1}{3} \mathrm{n}\left(2 \mathrm{n}^{2}+1\right)
$$

## Contribution/ Originality

This study contributes in the existing literature different approaches of determining non-zero distinct integer solutions to the homogeneous equation of degree three with 4 unknowns given by $\mathrm{x}^{3}+\mathrm{y}^{3}=21 \mathrm{zw}^{2}$

## 1. INTRODUCTION

Diophantine equations, homogeneous and non-homogeneous have aroused the interest of numerous mathematicians since antiquity can be seen as in [1-3]. The Diophantine equations offer an unlimited field for research due to their variety. The problem of finding all integer solutions of a Diophantine equation with three or more variables and degree at least three, in general presents a good deal of difficulties. Cubic equation in three variables falls into the theory but is still an important topic of current research [4-6]. Equations with more than three variables and degree at least three are known very little.

In particular, one may refer [7-18] for cubic equations with four unknowns. This research concerns with yet another interesting equation $x^{3}+y^{3}=21 z_{w}^{2}$ representing the homogeneous cubic equation with four unknowns for determining its infinitely many non-zero integer points. Also a few interesting properties are presented.

## 2. SOME INTERESTING PATTERNS

The homogeneous cubic Diophantine equation with four unknowns to be solved is given by $x^{3}+y^{3}=21 z w^{2}$
which is written as

$$
\begin{equation*}
(x+y)\left(x^{2}-x y+y^{2}\right)=21 z w^{2} \tag{2}
\end{equation*}
$$

Suppose

$$
\begin{equation*}
z=x+y \tag{3}
\end{equation*}
$$

Substitute (3) into (2), it reduces to the quadratic equation $\left(x^{2}-x y+y^{2}\right)=21 w^{2}$
Let $\mathbf{x}=\mathbf{u}+\mathbf{v}, \mathrm{y}=\mathbf{u}-\mathrm{v}$
where u and v are non-zero distinct arbitrary integers.
Substituting (5) in (4), it gives $\quad u^{2}+3 v^{2}=21 w^{2}$
Equation (6) is solved through different approaches and the different patterns of solutions of (1) obtained are presented below.

### 2.1 Pattern-1

Assume $w=a^{2}+3 b^{2}=(a+i \sqrt{3} b)(a-i \sqrt{3} b)$
Write 21 as $\quad 21=(3+\mathrm{i} 2 \sqrt{3})(3-\mathrm{i} 2 \sqrt{3})$
Using (7) and (8) in (6), it is written as
$(u+i \sqrt{3} v)(u-i \sqrt{3} v)=(3+i 2 \sqrt{3})(3-i 2 \sqrt{3})(a+i \sqrt{3} b)^{2}(a-i \sqrt{3} b)^{2}$
Suppose that following system of equations are derived from (9)
$(u+i \sqrt{3} v)=(3+i 2 \sqrt{3})(a+i \sqrt{3} b)^{2}$
$(u-i \sqrt{3} v)=(3-i 2 \sqrt{3})(a-i \sqrt{3} b)^{2}$
Equating the real and imaginary parts in either of the above two equations, we get

$$
\begin{aligned}
& u=3 a^{2}-9 b^{2}-12 a b \\
& v=2 a^{2}-6 b^{2}+6 a b
\end{aligned}
$$

Hence, in view of (3) and (5), we have

$$
\left\{\begin{array}{l}
x=x(a, b)=5 a^{2}-15 b^{2}-6 a b  \tag{10}\\
y=y(a, b)=a^{2}-3 b^{2}-18 a b \\
z=z(a, b)=6 a^{2}-18 b^{2}-24 a b
\end{array}\right\}
$$

Thus (7) and (10) represent non-zero distinct integer solutions for (1).
Properties of pattern-1: It is easy to infer following properties from (10)

- $x\left(n, 2 n^{2}-1\right)-5 y\left(n, 2 n^{2}-1\right)=6 y\left(n, 2 n^{2}-1\right)-z\left(n, 2 n^{2}-1\right)=84 n\left(2 n^{2}-1\right)=84 S_{n}$
- $\mathrm{z}(\mathrm{n}, \mathrm{n}(\mathrm{n}+1))-\mathrm{x}(\mathrm{n}, \mathrm{n}(\mathrm{n}+1))-\mathrm{w}(\mathrm{n}, \mathrm{n}(\mathrm{n}+1))-9 \mathrm{p}_{\mathrm{n}}^{5}=6 \mathrm{t}_{4, \mathrm{n}}$
- $\mathrm{x}\left(\mathrm{n}, 2 \mathrm{n}^{2}+1\right)-5 \mathrm{y}\left(\mathrm{n}, 2 \mathrm{n}^{2}+1\right)=84\left(\mathrm{n}, 2 \mathrm{n}^{2}+1\right)=252 \mathrm{OH}_{\mathrm{n}}$
- $x(n, n)-z(n, n)+w(n, n)-8 t_{4, n}=16 n^{2}$ , a perfect square
- $\mathrm{x}(\mathrm{n}, \mathrm{n})-\mathrm{z}(\mathrm{n}, \mathrm{n})+\mathrm{w}(\mathrm{n}, \mathrm{n})=24 \mathrm{n}^{2}$, a nasty number.

## Notes of pattern-1:

Instead of $(8)$, write 21 as $\quad 21=\frac{(3+i 5 \sqrt{3})-(3-i 5 \sqrt{3})}{4}$
Following the procedure presented in pattern-1, the corresponding integer solutions of (1) are

$$
\begin{aligned}
& x=x(a, b)=4 a^{2}-12 b^{2}-12 a b \\
& y=y(a, b)=-a^{2}+3 b^{2}-18 a b \\
& z=z(a, b)=3 a^{2}-9 b^{2}-30 a b \\
& w=w(a, b)=a^{2}+3 b^{2}
\end{aligned}
$$

### 2.2 Pattern-2

Equation (6) can be written as $u^{2}+3 v^{2}=21 w^{2} * 1$
Write 1 as $1=\frac{(1+\mathrm{i} \sqrt{3})(1-\mathrm{i} \sqrt{3})}{4}$
Using (7), (8) and (12) in (11), it is written as
$(u+i \sqrt{3} v)(u-i \sqrt{3} v)=(3+i 2 \sqrt{3})(3-i 2 \sqrt{3})(a+i \sqrt{3} b)^{2}(a-i \sqrt{3} b)^{2}\left(\frac{1+i \sqrt{3}}{2}\right)\left(\frac{1-i \sqrt{3}}{2}\right)$

Consider

$$
(u+i \sqrt{3} v)=(3+i 2 \sqrt{3})(a+i \sqrt{3} b)^{2}\left(\frac{1+i \sqrt{3}}{2}\right)
$$

Equating real and imaginary parts, we have

$$
\begin{aligned}
& \mathrm{u}=\frac{1}{2}\left[-3 \mathrm{a}^{2}+9 \mathrm{~b}^{2}-30 \mathrm{ab}\right] \\
& \mathrm{v}=\frac{1}{2}\left[5 \mathrm{a}^{2}-15 \mathrm{~b}^{2}-6 \mathrm{ab}\right]
\end{aligned}
$$

Substituting the above value of $u$ and $v$ in (3) and (5), we obtain

$$
\left\{\begin{array}{l}
x=x(a, b)=a^{2}-3 b^{2}-18 a b  \tag{12a}\\
y=y(a, b)=-4 a^{2}+12 b^{2}-12 a b \\
z=z(a, b)=-3 a^{2}+9 b^{2}-30 a b
\end{array}\right\}
$$

Thus (7) and (12a) represent non-zero distinct integer solutions for (1).
Properties of pattern-2: It is easy to infer following properties from (12a)

- $\mathrm{x}(\mathrm{n},-\mathrm{n})+\mathrm{w}(\mathrm{n},-\mathrm{n})=20 \mathrm{n}^{2}=20 \mathrm{t}_{4, \mathrm{n}}$
- $4 \mathrm{x}(\mathrm{n}, \mathrm{n}+1)+\mathrm{y}(\mathrm{n}, \mathrm{n}+1)=-84 \mathrm{n}(\mathrm{n}+1)=3 \mathrm{x}(\mathrm{n}, \mathrm{n}+1)+\mathrm{z}(\mathrm{n}, \mathrm{n}+1)$
- $3 \mathrm{w}(\mathrm{n}, \mathrm{n})-\mathrm{z}(\mathrm{n}, \mathrm{n})=36 \mathrm{n}^{2}$ is a perfect square
- $3\left\{\mathrm{x}\left(\mathrm{n}, 2 \mathrm{n}^{2}-1\right)+\mathrm{w}\left(\mathrm{n}, 2 \mathrm{n}^{2}-1\right)-18 \mathrm{SO}_{\mathrm{n}}\right\}=6 \mathrm{n}^{2}$, a nasty number
- $21^{2}\left\{17 \mathrm{x}\left(-\mathrm{n}, \mathrm{n}^{2}\right)+\mathrm{y}\left(-\mathrm{n}, \mathrm{n}^{2}\right)+\mathrm{z}\left(-\mathrm{n}, \mathrm{n}^{2}\right)\right\}=(42 \mathrm{n})^{3}$, a cubical integer.

### 2.3 Pattern-3

$$
\text { Instead of }(12) \text {, write } 1 \text { as } 1=\frac{(1+i 4 \sqrt{3})(1-i 4 \sqrt{3})}{49}
$$

Repeating the above process as in pattern- 2 , the non-zero distinct integral solutions of (1) are found to be

$$
\begin{aligned}
& x=x(a, b)=-a^{2}+3 b^{2}-18 a b \\
& y=y(a, b)=-5 a^{2}+15 b^{2}-6 a b \\
& z=z(a, b)=-6 a^{2}+18 b^{2}-24 a b \\
& w=w(a, b)=a^{2}+3 b^{2}
\end{aligned}
$$

Properties of pattern-3: It is easy to infer following properties from above equations

- $\quad 5 \mathrm{x}\left(\mathrm{n}^{2}, \mathrm{n}+1\right)-\mathrm{y}\left(\mathrm{n}^{2}, \mathrm{n}+1\right)=-84\left(\mathrm{n}^{2}, \mathrm{n}+1\right) \equiv 0(\bmod 84)$
- $3 x(n, n)-y(n, n)+165 t_{4, n}=8 \ln ^{2}$, a perfect square
- $\mathrm{w}(\mathrm{n}, \mathrm{n})+\mathrm{x}(\mathrm{n}, \mathrm{n})+$ perfect square $=\mathrm{n}^{2}=\mathrm{t}_{4, \mathrm{n}}$
- $6 \mathrm{x}\left(\mathrm{n}, 2 \mathrm{n}^{2}+1\right)-\mathrm{z}\left(\mathrm{n}, 2 \mathrm{n}^{2}+1\right)=252 \mathrm{OH}_{\mathrm{n}}$

### 2.4 Pattern-4

$$
\begin{equation*}
\text { One may write (6) as }\left(u^{2}-9 \mathrm{w}^{2}\right)=3\left(4 \mathrm{w}^{2}-\mathrm{v}^{2}\right) \tag{13}
\end{equation*}
$$

Write (13) in the form of ratio as

$$
\left(\frac{u+3 w}{3(2 w-v)}\right)=\left(\frac{2 w+v}{u-3 w}\right)=\left(\frac{a}{b}\right), b \neq 0
$$

Which is equivalent to the system of double equations

$$
\begin{aligned}
& u b+3 v a+w(3 b-6 a)=0 \\
& -u a+v b+w(2 b+3 a)=0
\end{aligned}
$$

Applying the method of cross-multiplication, we have

$$
\begin{align*}
& u=9 a^{2}-3 b^{2}+12 a b \\
& v=6 a^{2}-2 b^{2}-6 a b  \tag{14}\\
& w=3 a^{2}+b^{2} \tag{15}
\end{align*}
$$

Hence, in view of (3) and (5), the corresponding values of $\mathrm{x}, \mathrm{y}$ and z are given by

$$
\left\{\begin{array}{l}
x=x(a, b)=15 a^{2}-5 b^{2}+6 a b  \tag{15a}\\
y=y(a, b)=3 a^{2}-b^{2}+18 a b \\
z=z(a, b)=18 a^{2}-6 b^{2}+24 a b
\end{array}\right\}
$$

Thus (15) and (15a) represent non-zero distinct integer solutions for (1).
Properties of pattern-4: It is easy to infer following properties from (15a)

- $5 \mathrm{y}\left(\mathrm{n}, 2 \mathrm{n}^{2}-1\right)-\mathrm{x}\left(\mathrm{n}, 2 \mathrm{n}^{2}-1\right)-2 \mathrm{SO}_{\mathrm{n}}=82\left(\mathrm{n}, 2 \mathrm{n}^{2}-1\right) \equiv 0(\bmod 82)$
- $x(n, n+1)+y(n, n+1)-z(n, n+1)=0$
- $\mathrm{y}\left(\mathrm{n}, 19 \mathrm{n}^{2}-13\right)+\mathrm{w}\left(\mathrm{n}, 19 \mathrm{n}^{2}-13\right)-108 \mathrm{CP}_{19, \mathrm{n}}-\mathrm{t}_{14, \mathrm{n}}=5 \mathrm{n} \equiv 0(\bmod 5)$
- Each of the following represents a perfect square
- $6\left\{y\left(n, 19 n^{2}-13\right)+w\left(n, 19 n^{2}-13\right)-108 C P_{19, n}\right\}=36 n^{2}$
- $21\{6 \mathrm{y}(\mathrm{n}, \mathrm{n})-\mathrm{z}(\mathrm{n}, \mathrm{n})\}=(42 \mathrm{n})^{2}$

### 2.5 Pattern-5

Equation (6) can be written as $3 \mathrm{v}^{2}=21 \mathrm{w}^{2}-\mathrm{u}^{2}$
Write $v=21 a^{2}-b^{2}$
Write 3 as $3=\frac{(\sqrt{21}+3)(\sqrt{21}-3)}{4}$
Substituting (17) and (17a) in (16), we get
$(\sqrt{21} \mathrm{w}+\mathrm{u})(\sqrt{21} \mathrm{w}-\mathrm{u})=(\sqrt{21} \mathrm{a}+\mathrm{b})^{2}(\sqrt{21} \mathrm{a}-\mathrm{b})^{2}\left(\frac{\sqrt{21}+3}{2}\right)\left(\frac{\sqrt{21}-3}{2}\right)$
Consider

$$
(\sqrt{21} w+u)=(\sqrt{21} a+b)^{2}\left(\frac{\sqrt{21}+3}{2}\right)
$$

Equating rational and irrational parts, we have
$\mathrm{u}=\frac{1}{2}\left[63 \mathrm{a}^{2}+3 \mathrm{~b}^{2}+42 \mathrm{ab}\right] \quad$ and $\quad \mathrm{w}=\frac{1}{2}\left[21 \mathrm{a}^{2}+\mathrm{b}^{2}+6 \mathrm{ab}\right]$
Replacing a by 2 A and b by 2 B in (18), and using (3), (5),(17) and (17a), we have

$$
\begin{aligned}
& x=x(A, B)=210 A^{2}+2 B^{2}+24 A B \\
& y=y(A, B)=42 A^{2}+10 B^{2}+84 A B \\
& z=z(A, B)=252 A^{2}+12 B^{2}+168 A B \\
& w=w(A, B)=42 A^{2}+2 B^{2}+12 A B
\end{aligned}
$$

Properties of pattern-5:

- $6\left[y\left(n, n^{2}\right)-w\left(n, n^{2}\right)\right]-5 y\left(n, n^{2}\right)+x\left(n, n^{2}\right)=96 n^{3}=96 \mathrm{CP}_{6, \mathrm{n}}$
- $z(n, n+1)-6 w(n, n+1)=96 n(n+1)=6[y(n, n+1)-w(n, n+1)]-[5 y(n, n+1)-x(n, n+1)]$
- $\mathrm{y}(\mathrm{n}, \mathrm{n})-\mathrm{w}(\mathrm{n}, \mathrm{n})=80 \mathrm{n}^{2} \equiv 0(\bmod 80)$
- $\mathrm{y}(\mathrm{n}, \mathrm{n})-\mathrm{w}(\mathrm{n}, \mathrm{n})+\mathrm{t}_{4, \mathrm{~A}}=8 \ln ^{2}$, a perfect square
- $\mathrm{z}(\mathrm{n}, \mathrm{n})-6 \mathrm{w}(\mathrm{n}, \mathrm{n})=96 \mathrm{n}^{2}=$, a Nasty number

## 3. CONCLUSION

In this paper, we have illustrated different ways of obtaining non-zero distinct integer solutions to the homogeneous cubic equation with four unknowns given by $\mathrm{x}^{3}+\mathrm{y}^{3}=21 \mathrm{zw}^{2}$. As the Diophantine equations are rich in variety, one may search for the integral solutions of other forms of cubic Diophantine equations along with their corresponding properties.

## 4. ACKNOWLEDGEMENT

*The financial support from the UCG, New Delhi (F-MRP-5122/14(SERO/UCG) dated March 2014) for a part of this work is gratefully acknowledged.
